MINOR IN BIOINFORMATICS

At the intersection of biology and computer science, bioinformatics is the study of applying computational tools to collect and analyze complex biological data such as genomic sequences.

A minor in Bioinformatics will give students interested in biology a foundation in programming that will complement their biology backgrounds. In addition to programming, students will take basic courses in statistics and machine learning, leading up to coursework in bioinformatics. Computer Science has competitive entrance requirements.

Please contact a department advisor for more information.
